

JSM Cooperative Corporation

Google Ads API Basic Access Design Document

Prepared for Google Ads API Basic Access review. This document describes an internal server-side conversion measurement integration for JSM Cooperative Corporation.

Company website	https://jsmcoop.com
Google Ads customer account	651-712-2239
Google Ads manager account / developer token account	322-241-4378
Google Cloud project ID	jsmcoop-ads-api-305-2026
Google Cloud project number	375601457053
Primary users	Internal JSM Cooperative administrators only

Business Model

JSM Cooperative Corporation operates the public website jsmcoop.com to publish, promote, and sell JSM Cooperative book-related products and content. The current direct paid checkout flow sends visitors from the JSM website to a PayPal checkout page for a signed copy purchase. Google Ads is used by JSM Cooperative to promote its own website pages and book checkout funnel.

API Tool Overview

The tool is an internal conversion measurement integration built into the JSM Cooperative Flask website. It is not a public software product, agency platform, marketplace, or third-party ads management service. Its purpose is to help JSM Cooperative measure whether traffic from JSM-owned Google Ads campaigns reaches meaningful checkout actions.

Intended Audience

Only internal JSM Cooperative administrators and authorized contractors working directly for JSM Cooperative will use or maintain the tool. No external customers, clients, advertisers, or members of the public can access the Google Ads API tool.

Primary User Workflow

A visitor clicks a JSM Cooperative Google ad and lands on jsmcoop.com. The website stores campaign attribution parameters such as `gclid`, `gbraid`, `wbraid`, and UTM values in the visitor session/browser. If the visitor starts PayPal checkout from the signed-copy page, the server records a checkout ID and uploads a server-side click conversion to Google Ads for the JSM-owned conversion action. Separately, PayPal webhooks can confirm completed captures for future purchase conversion reporting.

Google Ads API Usage

The integration uses the Google Ads API only to upload click conversions for JSM Cooperative-owned traffic and conversion actions. The initial configured conversion action is PayPal checkout started, which is intended to

replace less useful generic click tracking. The tool does not create campaigns, mutate ads, modify budgets, access third-party accounts, or provide bid automation.

Data Accessed and Stored

The tool stores limited attribution and checkout metadata required for conversion matching: checkout ID, timestamp, landing/referrer data, UTM parameters, gclid/gbraid/wbraid when present, checkout provider, price amount, and currency. PayPal webhook logs are sanitized and used only for verification and matching. API credentials are stored as Heroku config variables and are not exposed to browser users.

Security and Access Controls

The website runs on Heroku. Sensitive values such as Google Ads API developer token, OAuth client secret, refresh token, PayPal client secret, and PayPal webhook ID are stored in Heroku config vars. The Google Ads OAuth app is authorized by the JSM Google account, and access is scoped to Google Ads API permissions required for conversion upload. Admin access to Heroku and Google Ads is restricted to authorized JSM account holders.

Accounts and Scope

The integration is intended for JSM Cooperative Corporation accounts only. The Google Ads customer account currently configured is 651-712-2239. The developer token is associated with manager account 322-241-4378. The Google Cloud project used for OAuth/API access is jsmpcoop-ads-api-305-2026, project number 375601457053.

Monitoring and Error Handling

Conversion upload attempts are logged server-side with non-sensitive status details. If required credentials, click identifiers, or conversion action IDs are missing, the website skips upload safely and records the reason. This prevents checkout flow disruption for visitors while allowing administrators to troubleshoot configuration issues.

Policy Position

JSM Cooperative is requesting Basic Access so the internal tool can upload conversion events for its own production Google Ads account. The tool is not used for App Conversion Tracking and Remarketing API, is not sold to others, and is not intended to access or manage accounts outside JSM Cooperative.
